Mallory's Pathologic Histology

Dr. Mallory here presents *pathology* from the morphologic point of view. He presents his subject biologically first by ascertaining the cellular elements out of which the various lesions are built up; then he traces the development of the lesions from the simplest to the most complex. He so presents pathology that you are able to trace backward from any given end-result, such as sclerosis of an organ (cirrhosis of the liver, for example) through all the various acute lesions that may terminate in that particular end-result to the primal *cause* of the lesion. With a knowledge of the complete development of the lesion before you, you are better able to summarize or even to state definitely *how* the lesion arose. The book is based on the study of *the lesions themselves—not* on the literature, although the opinions of other investigators have not been ignored. Dr. Mallory has written his book around perfect tissue, fixed and stained by the best methods known.

The *illustrations* are without exception the most beautiful ever published in connection with this subject. There are 683 of them, all but two original and the work of leading medical artists. The majority of the photomicrographs are Dr. Mallory's own work. The *colored illustrations* (there are 124 of them) are *printed directly in the text*. No troublesome inserts.

Dr. W. G. MacCallum, *College of Physicians and Surgeons, New York*

"I have looked over the book and think the plan is admirably carried out and that it supplies a need we have felt very much. I shall recommend it."

Octavo of 677 pages, with 497 figures containing 683 original illustrations, 124 in colors. By FRANK B. MALLORY, M.D., Associate Professor of Pathology at Harvard University Medical School.
Cloth, \$5.50 net; Half Morocco, \$7.00 net.
